Teleo-reactive programming was invented by Nils Nilsson [6, 7, 8]. We

• extend teleo-reactive programs with non-determinism

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ のQ@

- develop a time-interval semantics
- develop rely/guarantee reasoning rules and
- apply the rules to an example program

(Greek: telos: end, purpose)

Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

Overview

### **Teleo-reactive Programs**

Teleo-reactive programs are described by a combination of

- sensed values (inputs), or values derived or inferred from sensed values,
- primitive durative actions, i.e., actions that take time, and
- processes defined via (durative) prioritised conditionals.

Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

Nilsson's Tower program

## Nilsson's Tower Program

### makeTower(s) — s is an non-empty list with no duplicates

$$\begin{array}{rcl} \textit{Tower}(s) & \to & \textit{nil}, \\ \textit{Ordered}(s) & \to & \textit{unpile}(\textit{head}(s)), \\ \textit{Null}(\textit{tail}(s)) & \to & \textit{move\_to\_table}(\textit{head}(s)), \\ \textit{Tower}(\textit{tail}(s)) & \to & \textit{move}(\textit{head}(s), \textit{head}(\textit{tail}(s))), \\ & \textit{true} & \to & \textit{makeTower}(\textit{tail}(s)) \end{array}$$

### move\_to\_table(x) — x is a block

$$On(x, Ta) \rightarrow nil,$$
  
 $Holding(x) \rightarrow put\_down(x, Ta),$   
 $Clear(x) \rightarrow pick\_up(x),$   
 $true \rightarrow unpile(x)$ 

Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● ○ ○ ○ ○

#### Nilsson's Tower program

### move(x,y) - x and y are distinct blocks

$$On(x, y) \rightarrow nil,$$
  
 $Holding(x) \wedge Clear(y) \rightarrow put\_down(x, y),$   
 $Holding(z) \wedge x \neq z \rightarrow put\_down(z, Ta),$   
 $Clear(x) \wedge Clear(y) \rightarrow pick\_up(x),$   
 $Clear(y) \rightarrow unpile(x),$   
 $true \rightarrow unpile(y)$ 

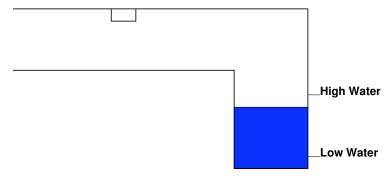

### unpile(x) - x is a block

$$Clear(x) \rightarrow nil,$$
  
 $On(y,x) \rightarrow move\_to\_table(y)$ 

pick\_up and put\_down are primitive actions.

Mine Pump

### Mine with methane - explodes if pump on

#### **Methane Detector**

Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

#### Mine Pump

# Mine Pump Example [3, 5, 4]

| mine_pump |                         |                   |
|-----------|-------------------------|-------------------|
|           | $Critical \leq methane$ | alarm,<br>operate |
|           |                         |                   |

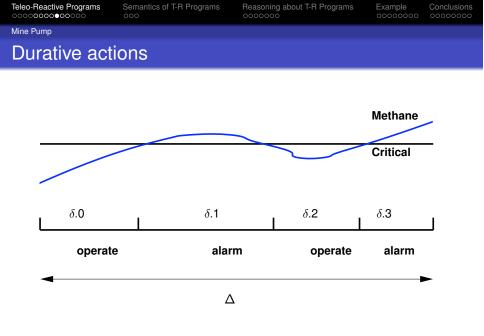

#### operate

| $\left( egin{array}{c} water > \textit{High} \lor \\ water > \textit{Low} \land \textit{pump}\_active \end{array}  ight)$ | $\rightarrow$ | pump, |
|---|---------------|-------|
| true  | $\rightarrow$ | nil   |

There are three sensed values:

- the level of methane in the mine, methane,
- the level of water in the mine, water, and
- an indicator of whether the pump is active, *pump\_active*.

#### It is not an Action System

◆□ > ◆□ > ◆三 > ◆三 > ● ● ● ●

| Teleo-Reactive Programs | Semantics of T-R Programs | Reasoning about T-R Programs | Example<br>00000000 | Conclusions |
|-------------------------|---------------------------|------------------------------|---------------------|-------------|
| Mine Pump               |                           |                              |                     |             |
| Expanded P              | Program                   |                              |                     |             |
|                         |                           |                              |                     |             |

### The above is equivalent to the following,

From this it is easy to see that the pump is only ever active while the methane level is not critical and the water level is at least above low.

Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

Mine Pump

## Rely/Guarantee for the Pump

### When the primitive action pump is active it guarantees

Pump guarantee

 $g\_pump \cong \Box(MinOut \le water\_out \land pump\_active)$ 

but relies on

Pump rely

 $r\_pump \cong \Box(Low < water \land methane < Critical)$ 

・ロト・日本・日本・日本・日本・日本

Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

Nondeterminism

Nondeterminism choice for deterministic procedure

For example, the mine\_pump procedure

mine\_pump

 $\begin{array}{rcl} \textit{Critical} \leq \textit{methane} & \rightarrow & \textit{alarm} \\ \sqcap \textit{methane} < \textit{Critical} & \rightarrow & \textit{operate} \end{array}$ 

is equivalent to earlier:

| mine_pump |                    |               |         |
|-----------|--------------------|---------------|---------|
|           | Critical < methane | $\rightarrow$ | alarm,  |
|           | true               | $\rightarrow$ | operate |

| Teleo-Reactive Programs | Semantics of T-R Programs | Reasoning about T-R Programs | Example<br>00000000 | Conclusions |
|-------------------------|---------------------------|------------------------------|---------------------|-------------|
| Nondeterminism          |                           |                              |                     |             |
| Nondetermi              | nism                      |                              |                     |             |
|                         |                           |                              |                     |             |

In general, the guard conditions of a nondeterministic choice do not need to be mutually exclusive. The following

operate specification

 $water > Low \rightarrow pump$  $\sqcap water \le High \rightarrow nil$ 

is refined by earlier:

#### operate

 $\left( \begin{array}{c} \textit{water} > \textit{High} \lor \\ \textit{water} > \textit{Low} \land \textit{pump}\_\textit{active} \end{array} \right) \rightarrow \textit{pump}, \\ \textit{true} \qquad \rightarrow \textit{nil}$ 

| Nondeterminism<br>Conditional | Teleo-Reactive Programs | Semantics of T-R Programs | Reasoning about T-R Programs | Example<br>00000000 | Conclusions |
|-------------------------------|-------------------------|---------------------------|------------------------------|---------------------|-------------|
| Conditional                   | Nondeterminism          |                           |                              |                     |             |
|                               | Conditional             |                           |                              |                     |             |

Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

Traces, Intervals and Predicates

### Timed traces and intervals

The semantics of a teleo-reactive program are given by specifying its set of behaviours over a given time interval. A behaviour is a trace of the values of program's variables over time.

If *c* is a predicate (condition) on the state of the program variables, we use the notation  $\Box c$  as a predicate over a time interval,  $\Delta$ , that states that condition *c* holds at all times in  $\Delta$ , i.e., ( $\Box c$ ). $\Delta$ .

Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

#### Rely/guarantee

## Satisfying a Rely/Guarantee Pair

#### **Definition** (Satisfies)

An action, *a*, *satisfies* a rely/guarantee pair, written " $r \{a\} g$ ", if all behaviours of *a* for which the rely condition holds also satisfy the guarantee condition, i.e.,

beh.a  $\land$  r  $\Rightarrow$  g

Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

**Rely/Guarantee Rules** 

### Basic Rely/Guarantee Theorem

### Theorem (Basic rely/guarantee)

For rely conditions r and r', guarantee conditions g and g', and an action a, if

$$r \Rightarrow r'$$
  
 $r' \{a\} g'$   
 $g' \land r \Rightarrow g$ 

then

r {**a**} g

|-------------------------|---------------------------|------------------------------|---------------------|-------------|
| Rely/Guarantee Rules    |                           |                              |                     |             |
| Guarded Ac              | tions                     |                              |                     |             |
|                         |                           |                              |                     |             |

### Theorem (Guarded action)

For a rely condition r, a guarantee condition g, a predicate c, and an action a,

$$r \{ \boldsymbol{c} \rightarrow \boldsymbol{a} \} \boldsymbol{g} \equiv (\Box \boldsymbol{c} \wedge \boldsymbol{r}) \{ \boldsymbol{a} \} \boldsymbol{g}$$

Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

**Rely/Guarantee Rules** 

## Decomposing (Rely) Conditions

### **Definition** (Decomposes)

A (rely) condition, r, *decomposes over intervals* if whenever r holds for an interval  $\Delta$ , it holds for its subintervals:

$$\forall \Delta, \Delta' : \textit{Interval} \bullet \Delta' \subseteq \Delta \land r.\Delta \Rrightarrow r.\Delta'$$

For example,  $\Box c$  decomposes over intervals, but  $r.\Delta \cong length.\Delta \ge 10$  does not.

Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

**Rely/Guarantee Rules** 

## Composing (Guarantee) Conditions

#### Definition (Composes)

A (guarantee) condition, g, composes over intervals if whenever g holds for every subinterval in a partition  $\delta$  of  $\Delta$ , it holds for  $\Delta$ :

 $\forall \Delta : Interval \bullet \forall \delta : part. \Delta \bullet$  $(\forall i : dom . \delta \bullet g.(\delta.i)) \Rightarrow g. \Delta$ 

For example,  $\Box c$  composes over intervals, and hence  $\Box (x = 0 \lor x = 1)$  composes but  $\Box (x = 0) \lor \Box (x = 1)$  does not.

Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

**Rely/Guarantee Rules** 

### Nondeterminism

### Theorem (Nondeterminism)

For rely condition r that decomposes over intervals, guarantee condition g that composes over intervals, and actions  $a_0$  and  $a_1$ ,

 $r \{a_0 \sqcap a_1\} g$ 

provided

 $(r \{a_0\} g) \land (r \{a_1\} g)$ 

Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

**Rely/Guarantee Rules** 

## **Two-Branch Conditional**

### Theorem (Conditional)

For a rely condition, r, that decomposes over intervals, a guarantee condition, g, that composes over intervals, predicates,  $c_0$  and  $c_1$ , actions,  $a_0$  and  $a_1$ ,

$$r \{c_0 \rightarrow a_0, c_1 \rightarrow a_1\} g$$

provided

$$((\Box c_0) \wedge r) \{a_0\} g \tag{5}$$

$$(\Box(\neg c_0 \land c_1) \land r) \{a_1\} g \tag{6}$$

$$r \Rightarrow \Box (c_0 \lor c_1) \tag{7}$$

## Mine Pump Rely/Guarantee

| mine_pump |                         |                   |
|-----------|-------------------------|-------------------|
|           | Critical $\leq$ methane | alarm,<br>operate |

satisfies the rely/guarantee pair, i.e.,

r {mine\_pump} g

provided

 $(\Box(Critical \le methane) \land r) \{alarm\} g$  $(\Box(methane < Critical) \land r) \{operate\} g$  $r \Rightarrow \Box(Critical \le methane \lor true)$ 

| Teleo-Reactive Programs | Semantics of T-R Programs | Reasoning about T-R Programs | Example<br>00000000 | Conclusions |
|-------------------------|---------------------------|------------------------------|---------------------|-------------|
| Proof                   |                           |                              |                     |             |

| $(\Box(Critical \leq methane) \land r) \{alarm\} g$                               | (8)  |
|---|------|
| $(\Box(methane < Critical) \land r) \{operate\} g$                                | (9)  |
| $r \Rightarrow \Box$ ( <i>Critical</i> $\leq$ <i>methane</i> $\lor$ <i>true</i> ) | (10) |

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○三 のへで

Requirement (10) holds trivially. Requirement (8) holds because *Critical*  $\leq$  *methane* is the complement of *methane* < *Critical* used on the left side of the implication within g. Semantics of T-R Programs

Reasoning about T-R Programs

Example Conclusions

Proof

### For requirement (9) we need to show procedure operate

satisfies

 $(\Box(methane < Critical) \land r) \{operate\} g$ 

Let *c* be the guard on the first branch of procedure operate. The conditions we need to show are

> $(\Box(c \land methane < Critical) \land r) \{pump\} g$  $(\Box(\neg c \land methane < Critical) \land r) \{nil\} g$  $\Box(methane < Critical) \land r \Rightarrow \Box(c \lor true)$

| Teleo-Reactive Programs | Semantics of T-R Programs | Reasoning about T-R Programs | Example<br>00000000 | Conclusions |
|-------------------------|---------------------------|------------------------------|---------------------|-------------|
| Proof                   |                           |                              |                     |             |
|                         |                           |                              |                     |             |
|                         |                           |                              |                     |             |

| $(\Box(c \land methane < Critical) \land r) \{pump\} g$   | (11) |
|---|------|
| $(\Box(\neg c \land methane < Critical) \land r) \{nil\} g$   | (12) |
| $\Box$ ( <i>methane</i> < <i>Critical</i> ) $\land$ <i>r</i> $\Rightarrow$ $\Box$ ( <i>c</i> $\lor$ <i>true</i> ) | (13) |

Requirement (13) is trivial.

For (12), the negation of *c* implies that water  $\leq$  High, which implies the left side of the implication in *g* is false. Requirement (11) follows from the rely and guarantee conditions of pump, provided

 $\Box(c \land methane < Critical) \land r \implies r\_pump$  $g\_pump \land \Box(c \land methane < Critical) \land r \implies g$ 

| Teleo-Reactive Programs | Semantics of T-R Programs | Reasoning about T-R Programs | Example<br>0000000 | Conclusions |
|-------------------------|---------------------------|------------------------------|--------------------|-------------|
| Proof                   |                           |                              |                    |             |

 $\Box(c \land methane < Critical) \land r \implies r\_pump$  $g\_pump \land \Box(c \land methane < Critical) \land r \implies g$ 

The first requirement holds because *c* implies water > Low. For the second requirement, from *r* we have

$$\frac{dwater}{dt} = water_in - water_out$$

$$\Rightarrow as g_pump \text{ implies } MinOut \le water_out$$

$$\frac{dwater}{dt} \le water_in - MinOut$$

$$\Rightarrow as r \text{ implies } water_in \le MaxIn$$

$$\frac{dwater}{dt} \le MaxIn - MinOut$$

The teleo-reactive programming paradigm of Nilsson provides a remarkably simple notation for expressing robust real-time control programs. In this paper we have

- developed a time-interval semantics for teleo-reactive programs and
- provided rely/guarantee reasoning rules that have been shown correct with respect to these rules.

For some teleo-reactive programs guarded actions may only be active for an instant during which time they change the state to disable themselves. There are two approaches we can follow to address these instantaneous actions, either

- enrich our semantics to allow a finite number of instantaneous actions to happen at the same real time, or
- make use of the notion of time bands [2, 1].

For the latter, a system description can be structured into a number of time bands each with its timing precision. At a higher-level time band an action may be considered instantaneous if it is within the precision of the band, but within a lower level band the same action may be viewed as taking time.
